

NAME: SANVIKA M NAIK

SRN: PES1UG24AM253

SEM: 5 SECTION: E

SE LAB

The image displays two screenshots of the Jira interface, specifically the 'SL board' and 'Jira work item' panels.

Top Screenshot:

- SL board:** Shows the 'Backlog' tab. The 'Epic' section is expanded, showing 'EPIC01' with a key of 'SL-1', 2 work items, 2 completed, and an estimate of 13 points. The 'Child work items' section shows a progress bar at 100% Done. The table lists two items: 'SL-6' (Story 1.1 - PII...) and 'SL-7' (Story 1.2 - ...), both with a status of 'Done'.
- Jira work item:** Shows the 'Child work items' section with a progress bar at 100% Done. The table lists two items: 'SL-9' (Story 3.1 - Searc...) and 'SL-10' (Story 3.2 - Fast...), both with a status of 'Done'.

Bottom Screenshot:

- SL board:** Shows the 'Backlog' tab. The 'Epic' section is expanded, showing 'EPIC02' and 'EPIC03'. 'EPIC03' has a key of 'SL-3', 2 work items, 2 completed, and an estimate of 21 points. The 'Child work items' section shows a progress bar at 100% Done. The table lists two items: 'SL-9' (Story 3.1 - Searc...) and 'SL-10' (Story 3.2 - Fast...), both with a status of 'Done'.
- Jira work item:** Shows the 'Child work items' section with a progress bar at 100% Done. The table lists two items: 'SL-9' (Story 3.1 - Searc...) and 'SL-10' (Story 3.2 - Fast...), both with a status of 'Done'.

STORY LINES GIVEN TO EACH EPIC:

Story 1.1 — PII Field Masking: As a Compliance Officer, I want the system to automatically mask PII fields (SSNs, credit card numbers) in ingested logs, so that personal data is protected before storage.

Story 1.2 — Configurable Masking Rules: As a Compliance Officer, I want to define and update masking rules via an admin interface, so that I can react to new PII fields without engineering help.

Story 2.1 — Hash Chain Generation: As a Security Auditor, I want each audit record to have a SHA-256 hash chained to the previous record, so that any tampering with historical logs is detectable.

Story 3.1 — Search & Filter Logs: As a Security Auditor, I want to search and filter logs by actor, event type, date range, and source application, so that I can quickly narrow down relevant events.

Story 3.2 — Fast Query Performance: As a Security Auditor, I want filtered queries across 10 million records to return in under 1 second, so that investigations aren't slowed down.

Story 4.1 — Signed Export Bundle: As a Security Auditor, I want to generate a digitally signed, immutable export (PDF/CSV + manifest), so that regulators can independently verify authenticity.

BURNDOWN CHART AND SUMMARY

Burndown Chart

Questions:

- 1.** Mostly yes. High-effort stories like the search with 10M records got higher points , while simpler tasks like PII masking got lower points, which felt like a fair split based on complexity.
- 2.** Yes, the backlog was prioritized by core function first, PII masking and hash integrity were marked High priority since they're foundational, while the export feature was Medium since it depends on the other pieces being done first.
- 3.** It aligned well, Sprint 1 covered the core ingestion, integrity, and search features, and Sprint 2 handled the remaining export and configuration stories, matching the logical build order I'd planned.
- 4.** Since this was a simulated solo sprint, the burndown chart showed a steep, immediate drop instead of gradual daily progress — in a real team setting, it would show a more even decline as work gets done incrementally across the week.
